PAPER TODAY

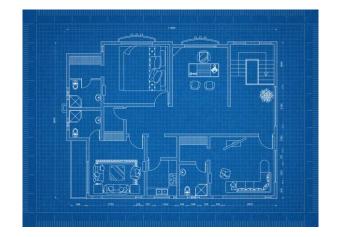

Dall-E 2: cats learning C++ in the forest on '90's technology

<u>CLASS</u> vs. <u>OBJECT</u>

• Class is the blueprint; object is an INSTANCE of the class

CLASS

blueprint

OBJECT

building

CLASS vs. OBJECT

• Class is the blueprint; object is an INSTANCE of the class

CLASS

cookie cutter

OBJECT

cookie

STRENGTH in COMMUNITY

Join us at crownheightsmutualaid.com/slack or on Facebook at Crown Heights Mutual Aid

CROWN HEIGHTS MUTUAL AID is a network of neighbors supporting one another and the most vulnerable in our community in the face of this pandemic and the crises we face from climate change, state violence, and inequality. We

all have something to offer and we all have something we need.

- Early March 2020
- Spontaneous, reaction; at the same time, there is a deep history of these movements
- Started both analog & digital: Slack, Facebook, posters
- "The real threat to Power is breaking their monopoly on creating" (Mutual Aid Disaster Relief, lessons learned)

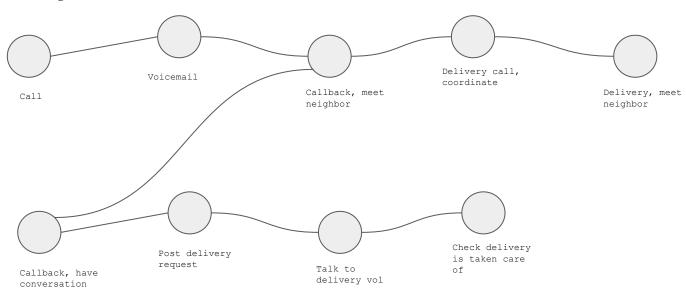

What we had:

- Need list (growing) turning to new places, everything shut
- **Volunteer base** (growing) time, interest: delivery, phone calls, donations
- **Technical** savvy, for some (Slack, Facebook, Twitter, etc. so much time on these platforms)
- Small team of coders (3-20), larger group using system
- Security minded

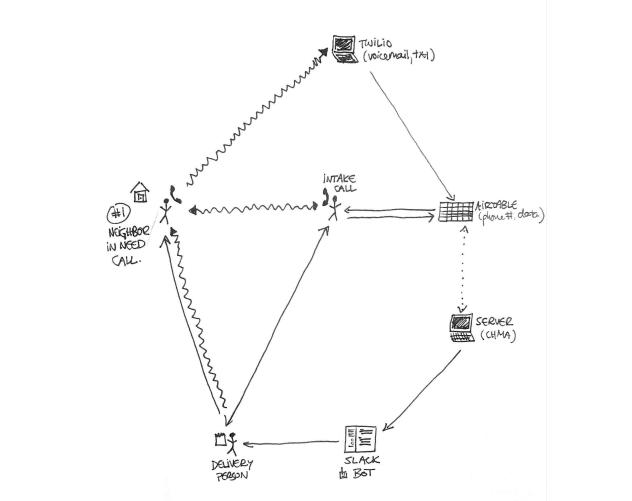

What we needed:

 Way to connect local neighbors in need with local neighbors able to give

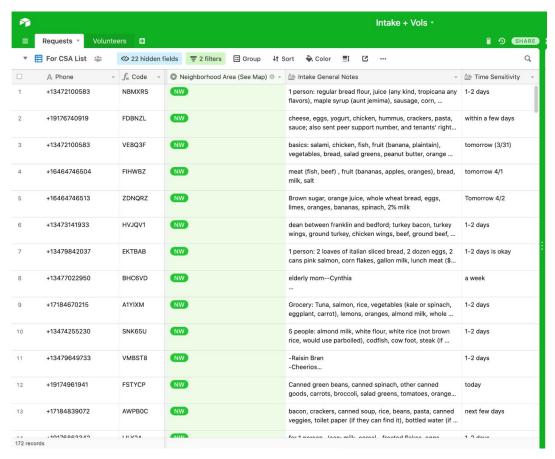

[Neighbor in Need]

[Intake Volunteer]

Step 2: database, intake

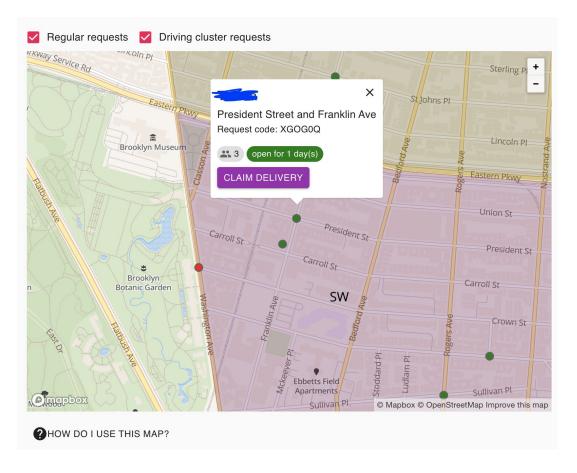

- "Intake" volunteer, uses the relational database (Airtable) like a call sheet; unique code generated
- First connection made: neighbor in need to neighbor on the phone (shifts, parties)
- Fills out fields that are empty from phone conversation

DATA SECURITY:

vulnerable; but only
keeps first names, and
cross street

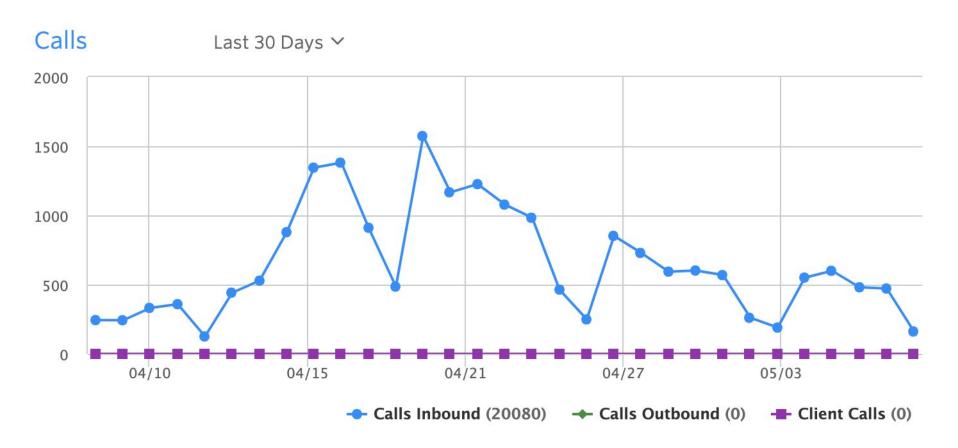

ullet Volume ...

Version 2.0 delivery system: web map

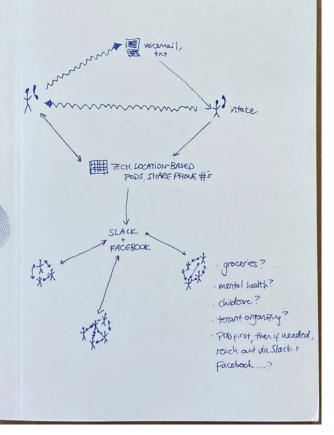

- When intake volunteer changed status column in Airtable to "Needs Delivery" call sent to endpoint on Node.js server
- Used Google Maps API to geolocate cross streets, place them on web map (front-end: Mapbox)

SCALE SCALE SCALE SCALE SCALE

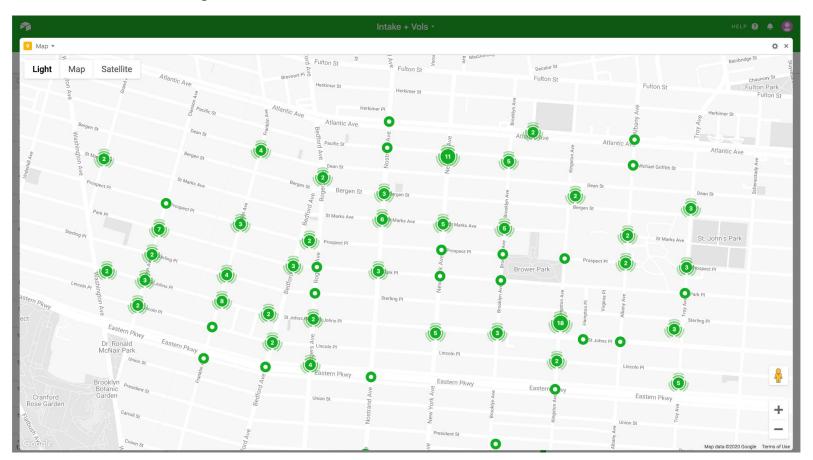

Rehearsing Solidarity Learning from Mutual Aid

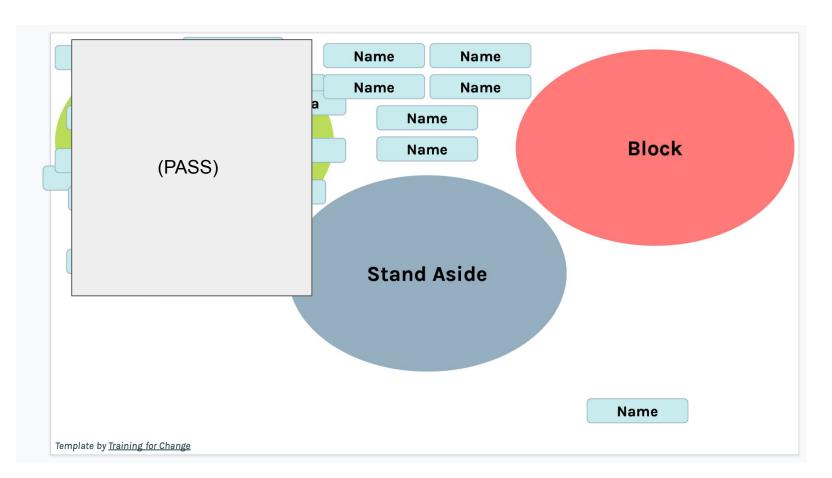

Extensions & Projects:

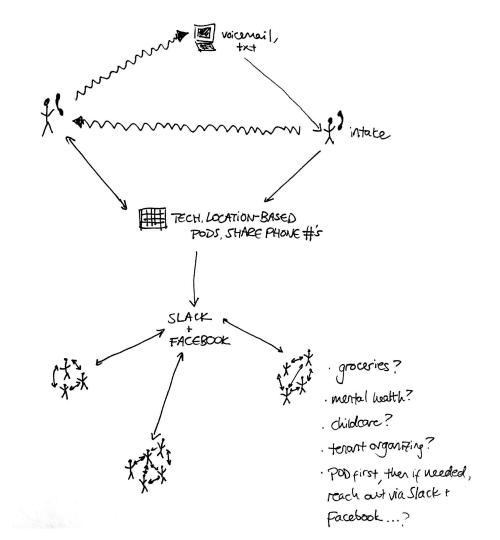

Collective Decision-Making (DATA)

Extensions & Projects:

- Goals beyond deliveries: more connected and organized communities; spontaneous, autonomous connections; someone to call in a crisis; relationships to neighbors across age, race, class etc.
- "Anarchist Uber Eats" ? vs. PODS

software design sprint!

- Google, but used all over
- Typically 5 days, with functioning prototype @ the end
- "Don't let perfect be the enemy of the good," make a decision and move forward with it, for exercise
- Prototype mentality: airBnb example
- Less about research, more about GO

FILE STRUCTURE

imagine class called Neighbor

Neighbor

#include

.h

Class encapsulation,
(attributes, member
data, declarations)

main.cpp

Neighbor.c

Class methods
(function
definitions)

#include

CONSTRUCTOR

- object initialization function, runs automatically
- declared in **public** encapsulation
- Funny definitions syntax ... DOES NOT HAVE RETURN TYPE!

```
example: class named Neighbor
```

```
Neighbor::Neighbor() {
```

}
